What does the world have to gain?

People who are in situations of environmental injustice **will find tools for support and communication** with other individuals who have experienced or are experiencing a similar condition.

Looking forward to **promoting awareness** to the general public about their issues.

The contact with the reality of marginalized people in the world, and to perceive how climate change affects their lives will help to bring public enlightenment to all these problems.

Where is the opportunity?

We believe that **change must start with people**. The environmental problem is one of the biggest of the century.

It is common that **marginalized people** don't have a full view of the problem and cannot speak for themselves, so **we try to support them to claim their right to a more egalitarian environment**.

The challenge and environmental injustice:

Environmental justice is a concept and a movement to **reduce social and economic asymmetries arising from the environmental context**. Unluckily, it is not always followed, occurring scarcity of essential resources, imbalance of ecosystems, natural disasters, and climatic phenomena that do not respect geographic distributions and impacting classes, gender, and race.

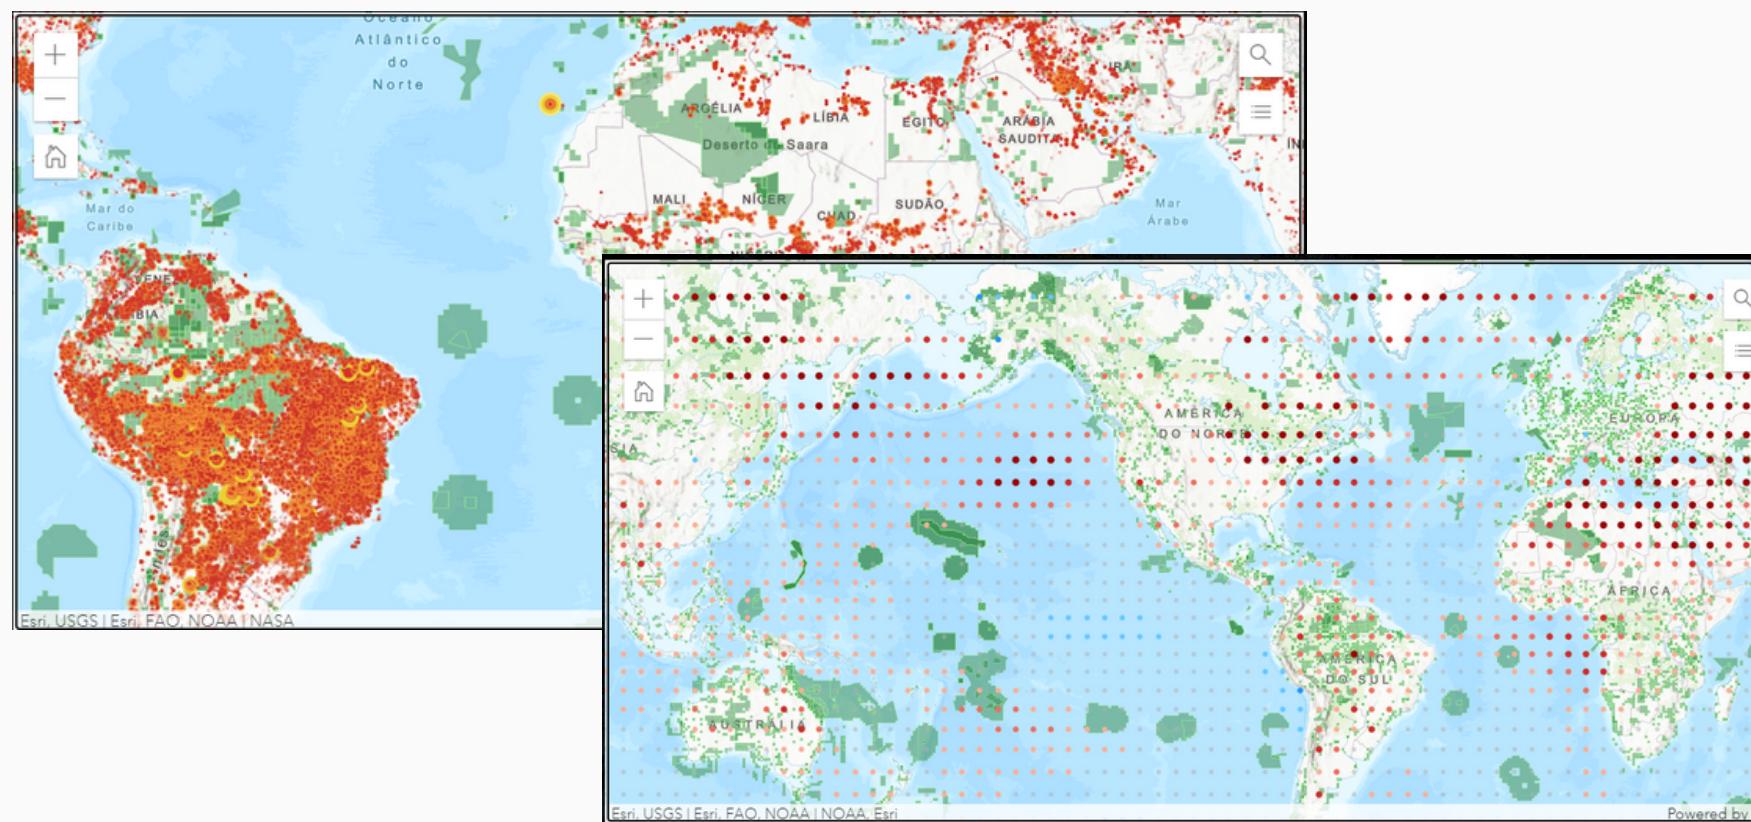

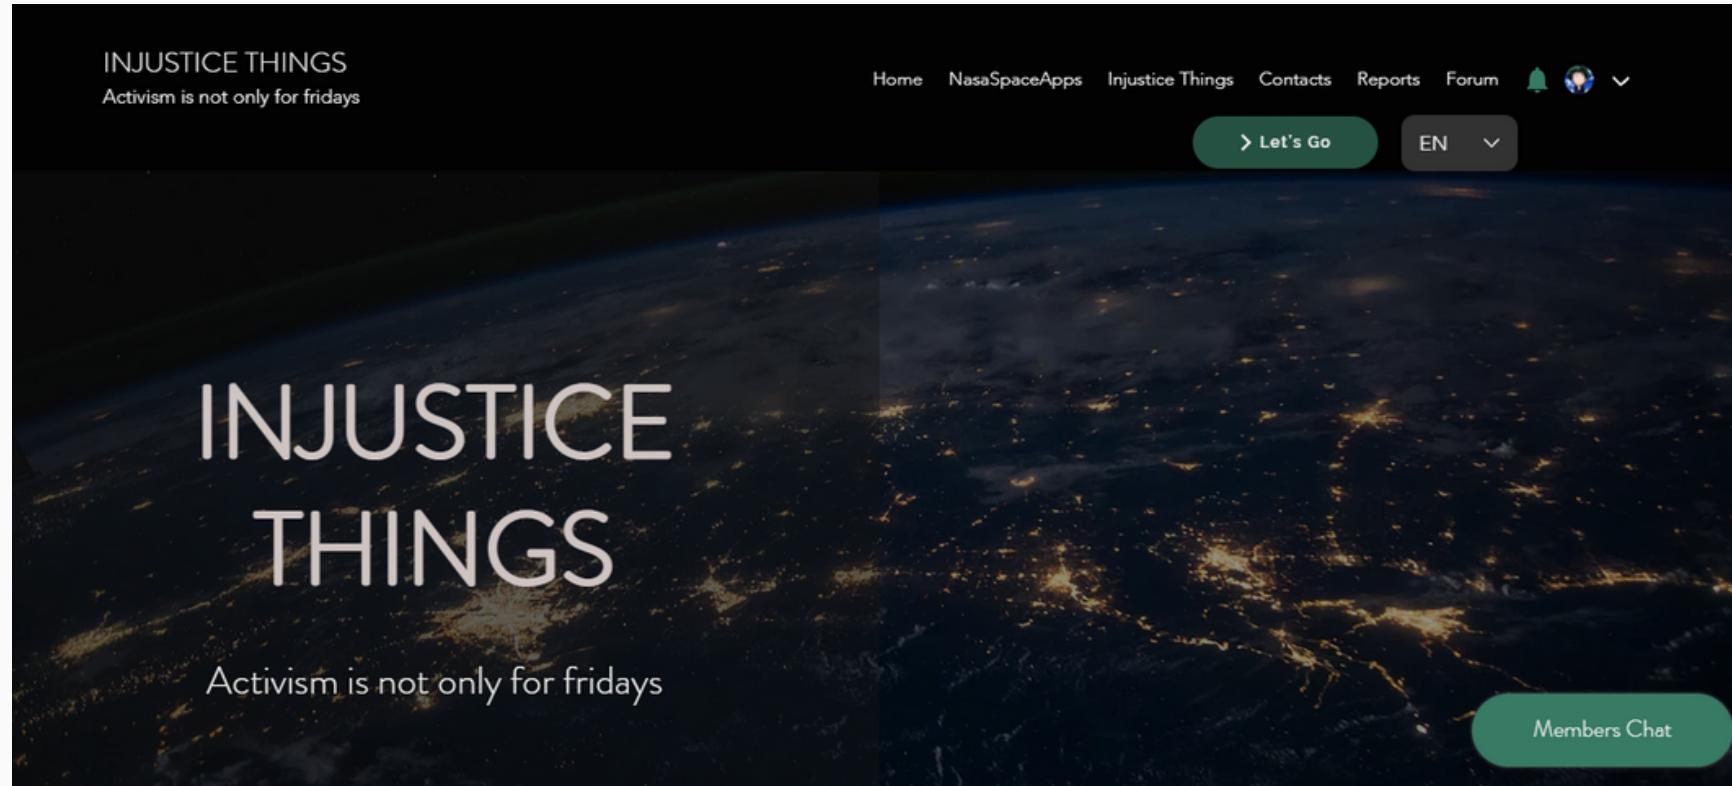

The most affected communities are often marginalized, so those societies don't have the economic tool to repair themselves. **Our objective is to identify regions where this injustice occurs and design solutions** to help the population.

What problem do we solve?

From the challenge, our group has developed a platform in which it will be willing to help **highlight where environmental injustices occur around the world** against the population and some ways to **solve these problems through education** and movement ahead of these events together with our users from our site.

In the Injustice Things platform, it is possible to increase the ability to correlate facts, identify where social injustices occur, **report, observe scientific data, petitions** and in this way promote **critical thinking** to people. It is equally possible to **interact on the Forum.**

The platform as a solution:

"Education and critical thinking are the solution to combat environmental injustices"

What will you find on our platform?

- Interactive maps designed by our team compiling different NASA satellite data;
- Global and regional analysis of graphics that relate to various themes;
- Geographical, historical, economic, physical, biological, social interpretation, among others, for each map with grounded facts and tangible examples to identify environmental injustices;
- Anonymous reporting channel with tracking and "trend topics" of the most reported subjects;
- Communication channel among users through a forum;
- Up-to-date posts and relevant news from around the world, indications of videos, movies, readings;
- Real-time chat between users and website developers;
- To learn about other features, visit the platform!

What was done? What does the future hold?

The nexts steps for the “Injustice Things” project are to secure **financial support** through advertisements on the site, looking for financial partners that share with us the same objectives in socio-political and environmental issues.

We are thinking of partnering with entities within colleges and NGOs to boost the number of users on the platform. By using those resources, **we can be the last resource for those forgotten by the government and society, and be the last straw for them to change their lives.**
